SciScore Report

Below you will find your SciScore report containing three tables. Your score is calculated based on adherence to scientific rigor criteria (Table 1) and identification of key biological resources (Table 2). Table 3 contains statistical tests and oligonucleotides but is not scored. If SciScore makes any mistakes, please contact us to help us learn and improve.

Table 1: Rigor Adherence Table

Ethics
IRB: This study was approved by the Institutional Review Board of Stanford University and adhered to the Declaration of Helsinki and the Health Insurance Portability and Accountability Act Subjects were evaluated and recruited at Byers Eye Institute at Stanford University Medical Center between April and October 2019.
Inclusion and Exclusion Criteria
For the exclusion criteria, we excluded all subjects with intraocular pressure greater than 21 mm Hg or history of any other optic neuropathies, including glaucoma.
Attrition
not detected.
Sex as a biological variable
not detected.
Subject Demographics
Age: not detected.
Weight: not detected.
Randomization
not detected.
Blinding
not detected.
Power Analysis
not detected.
Replication
Results are shown as mean fluorescence intensity averaged between duplicates for each sample and normalized against Chex 4 values.

Number: Results are shown as mean fluorescence intensity averaged between duplicates for each sample and normalized against Chex 4 values.

Table 2: Key Resources Table

Your Sentences	REAGENT or RESOURCE	SOURCE	IDENTIFIER

Other Entities Detected

Your Sentences	Recognized Entity
Statistical Tests	
We compared the mean values between control and chronic NAION groups with t-tests and tested the significance of the coefficient of group in multiple linear regressions of protein measurements when sex and age were also covariates.	t-tests
We checked whether the resulting P values were significant after Bonferroni correction for testing 76 proteins (P < 0.176 = 0.0013).	Bonferroni
We then performed principal component analysis (PCA) with subjectively chosen clusters, hierarchical clustering and Spearman correlations of the molecules that had P < 0.05 for status effect in multiple linear regression or P < 0.05 in the permutation test.	Spearman correlations

SciScore is an automated tool that is designed to assist expert reviewers by finding and presenting formulaic information scattered throughout a paper in a standard, easy to digest format. ***SciScore is not a substitute for expert review.*** SciScore also checks for the presence and correctness of several unique identifiers, including RRIDs (research resource identifiers) in the manuscript, detects sentences that appear to be missing RRIDs, and can even suggest RRIDs under certain circumstances. **All RRID suggestions should be verified;** only the author can know whether the suggestions are correct.
