SciScore Report

Below you will find your SciScore report containing three tables. Your score is calculated based on adherence to scientific rigor criteria (Table 1) and identification of key biological resources (Table 2). Table 3 contains statistical tests and oligonucleotides but is not scored. If SciScore makes any mistakes, please contact us to help us learn and improve.

Table 1: Rigor Adherence Table

Ethics
Consent: Inclusion criteria for the patient group were as follows: having diagnosed with CP by the pediatric neurologist based on medical history, clinical, and imaging findings; age <18 years; and having consent from his/her parents or legal guardians to participate in the study.
IRB: The study protocol was approved by the Ethics Committee of Mersin University.
Inclusion and Exclusion Criteria
The control group was composed of 200 individuals who were referred to the Children#s Health Department of the institution and fulfilled inclusion criteria.
Attrition
not detected.
Sex as a biological variable
Age and sex were matched with the propensity score method and 176 children (101 males, 75 females; mean age 71.8±37.9 months; range, 24 to 184 months) for the patient group and 178 children (90 males, 88 females; mean age 69.3±55.2 months; range, 24 to 214 months) for the control group were included in the study.
Subject Demographics
Age: Age and sex were matched with the propensity score method and 176 children (101 males, 75 females; mean age 71.8±37.9 months; range, 24 to 184 months) for the patient group and 178 children (90 males, 88 females; mean age 69.3±55.2 months; range, 24 to 214 months) for the control group were included in the study.
Randomization
not detected.
Blinding
not detected.
Power Analysis
Statistical analysis In the reference study, the incidence of COL4A1 (rs1961495) T allele in the control group was given as 44.8% with an odds ratio of 1.387.[3] Accordingly, it was planned to enroll 173 individuals in

the patient group, 173 individuals in the control group, and a total of a minimum of 346 individuals with 80% study power and 5% type I error.	
Replication	
not required.	
Data Information	
Identifiers: Genotypic analysis of COL4A1 (rs1961495) and COL4A2 (rs9521733) polymorphisms The genotyping of analysis of the COL4A1 (rs1961495) and COL4A2 (rs9521733) polymorphisms were performed using a full-blood commercial kit , High Pure PCR Template Preparation Kit (Roche Applied Science , Penzberg , Germany) .	rs1961495 rs9521733
Identifiers: The polymorphisms of the COL4A1 gene (rs196149) and COL4A2 gene (rs9521733) were performed using a pre-designed LightSNIP assay (TIB Molbiol , Berlin , Germany)	rs196149

Table 2: Key Resources Table

Your Sentences	REAGENT or RESOURCE	SOURCE	IDENTIFIER

Other Entities Detected

Your Sentences	Recognized Entity
Statistical Tests	
The Shapiro-Wilk test was used to check the normality of continuous variables.	Shapiro-Wilk test
Accordingly, the Student's t-test was used to compare the mean of two independent groups.	t-test
The chi-square test was used to analyze the relationship and distribution of categorical variables.	chi-square test
The Cochran-Armitage trend test was used to determine the relationship of COL4A1 and COL4A2 gene polymorphisms with categorical variables.	Cochran-Armitage trend test

SciScore is an automated tool that is designed to assist expert reviewers by finding and presenting formulaic information scattered throughout a paper in a standard, easy to digest format. ***SciScore is not a substitute for expert review.*** SciScore also checks for the presence and correctness of several unique identifiers, including RRIDs (research resource identifiers) in the manuscript, detects sentences that appear to be missing RRIDs, and can even suggest RRIDs under certain circumstances. **All RRID suggestions should be verified;** only the author can know whether the suggestions are correct.
