SciScore Report

Below you will find your SciScore report containing three tables. Your score is calculated based on adherence to scientific rigor criteria (Table 1) and identification of key biological resources (Table 2). Table 3 contains statistical tests and oligonucleotides but is not scored. If SciScore makes any mistakes, please contact us to help us learn and improve.

Table 1: Rigor Adherence Table

Ethics
not required.
Inclusion and Exclusion Criteria
In this sense , more than two parameters may be collinear and when they are recognized , just one should be retained , and the others should be dropped.
Attrition
One of these methods is linear averaging, where simple or weighted averaging can be used.
Sex as a biological variable
not required.
Subject Demographics
Age: not required.
Weight: not required.
Randomization
For the hyperparameter optimization, a random seed number is fixed for the training process.
Blinding
not detected.
Power Analysis
not detected.
Replication
Processes such as data gathering , removal of duplicates and low-variance features , missing value imputation , collinearity assessment , data characteristics , outlier removal , feature selection for modeling , data splitting , and data scaling are described in detail .

Number: Processes such as data gathering , removal of duplicates and low-variance features , missing value imputation , collinearity assessment , data characteristics , outlier removal , feature selection for modeling , data splitting , and data scaling are described in detail .

Table 2: Key Resources Table

Your Sentences	REAGENT or RESOURCE	SOURCE	IDENTIFIER
Software and Algorithms			
Hyperopt 154 is a Python library developed for hyperparameter optimization , which is suitable for both categorical and numerical searching spaces .	Python		Suggestion: python-bx (RRID:SCR_024202)(link)

Other Entities Detected

Your Sentences	Recognized Entity
Statistical Tests	
The Spearman correlation factor (R) is the preferred option to assess the collinearity among the independent parameters for the non-normal distribution of the features data .	Spearman correlation

SciScore is an automated tool that is designed to assist expert reviewers by finding and presenting formulaic information scattered throughout a paper in a standard, easy to digest format. ***SciScore is not a substitute for expert review.*** SciScore also checks for the presence and correctness of several unique identifiers, including RRIDs (research resource identifiers) in the manuscript, detects sentences that appear to be missing RRIDs, and can even suggest RRIDs under certain circumstances. **All RRID suggestions should be verified;** only the author can know whether the suggestions are correct.
