SciScore Report

Below you will find your SciScore report containing three tables. Your score is calculated based on adherence to scientific rigor criteria (Table 1) and identification of key biological resources (Table 2). Table 3 contains statistical tests and oligonucleotides but is not scored. If SciScore makes any mistakes, please contact us to help us learn and improve.

Table 1: Rigor Adherence Table

Ethics
IRB: The Institutional Review Board approved all study procedures.
Inclusion and Exclusion Criteria
The responses of 18 additional students who did not complete the post survey were excluded.
Attrition
Eight students missed the pre survey or opted out of participation, and one student dropped the course.
Sex as a biological variable
Pretest individual interest and frequencies of females and underrepresented minorities did not differ between CTRL and UVR groups.
Subject Demographics
Age: not detected.
Weight: not detected.
Randomization
To assign treatments, we used block randomization to ensure equal sample sizes and reduce the potential for error in administering the intervention and control conditions (Suresh, 2011).
Blinding
The course instructor, the undergraduate TAs, and the students in the course were blind to experimental treatments, which the laboratory coordinator administered for all course sections.
Power Analysis
not detected.
Replication
not required.

Table 2: Key Resources Table

Your Sentences	REAGENT or RESOURCE	SOURCE	IDENTIFIER

Other Entities Detected

Your Sentences	Recognized Entity
Statistical Tests	
Before experimental analysis, we used chi-squared and Welchs two-sample t tests to verify successful randomization, that is, no significant differences existed between control and intervention groups for baseline covariates (Table 3).	chi-squared
	t tests
However, a significant chi-squared test indicated that first-generation college attendance was non-independent from the treatment condition.	chi-squared test
Because we hypothesized positive associations between the intervention and situational interest, we used one-sided significance tests for post hoc pairwise Tukeys tests (Figure 1).	Tukeys tests

SciScore is an automated tool that is designed to assist expert reviewers by finding and presenting formulaic information scattered throughout a paper in a standard, easy to digest format. ***SciScore is not a substitute for expert review.*** SciScore also checks for the presence and correctness of several unique identifiers, including RRIDs (research resource identifiers) in the manuscript, detects sentences that appear to be missing RRIDs, and can even suggest RRIDs under certain circumstances. **All RRID suggestions should be verified;** only the author can know whether the suggestions are correct.
