Document Identifier: **PMC8840325**

SciScore Report

Below you will find your SciScore report containing three tables. Your score is calculated based on adherence to scientific rigor criteria (Table 1) and identification of key biological resources (Table 2). Table 3 contains statistical tests and oligonucleotides but is not scored. If SciScore makes any mistakes, please contact us to help us learn and improve.

Table 1: Rigor Adherence Table

Ethics
not required.
Inclusion and Exclusion Criteria
To alleviate artifacts caused by head motion, subjects with mean frame-to-frame displacement > 0.1 mm or maximum frame-to-frame displacement > 0.15 mm were excluded.
Attrition
not required.
Sex as a biological variable
The resulting dataset contains 493 subjects (266 females, age = 22–36+, subject IDs listed in supplementary material).
Subject Demographics
Age: not required.
Weight: not required.
Randomization
A permutation test was performed by randomly shuffling the task labels of the scans before building the gradient-boosting classifier and evaluating the predictive power in the same way as described above.
Blinding
not detected.
Power Analysis
The accuracies range between 0% and 100% and higher accuracy indicates stronger predictive power.
Replication
not required.

Table 2: Key Resources Table

Your Sentences	REAGENT or RESOURCE	SOURCE	IDENTIFIER

Other Entities Detected

Your Sentences	Recognized Entity
Statistical Tests	
Statistical test comparing homogeneity distributions For each node, the distributions of homogeneity across subjects under different states (tasks) are compared using paired t-test.	t-test
The distributions of mean homogeneity across subjects and states for different fixed atlases (Shen 268, Shen 368, and Yeo 1041) are compared using F test because the numbers of nodes are different for different parcellations.	F test
Here the similarity between vectors was evaluated by Pearson correlation.	Pearson correlation

SciScore is an automated tool that is designed to assist expert reviewers by finding and presenting formulaic information scattered throughout a paper in a standard, easy to digest format. ***SciScore is not a substitute for expert review.*** SciScore also checks for the presence and correctness of several unique identifiers, including RRIDs (research resource identifiers) in the manuscript, detects sentences that appear to be missing RRIDs, and can even suggest RRIDs under certain circumstances. **All RRID suggestions should be verified;** only the author can know whether the suggestions are correct.
