Document Identifier: **PMC8933564**

SciScore Report

Below you will find your SciScore report containing three tables. Your score is calculated based on adherence to scientific rigor criteria (Table 1) and identification of key biological resources (Table 2). Table 3 contains statistical tests and oligonucleotides but is not scored. If SciScore makes any mistakes, please contact us to help us learn and improve.

Table 1: Rigor Adherence Table

Ethics
IRB: The research protocol was approved by the Western Sydney Local Health District Human Research Ethics Committee and all participants provided written consent.
Consent: The research protocol was approved by the Western Sydney Local Health District Human Research Ethics Committee and all participants provided written consent.
Inclusion and Exclusion Criteria
Exclusion criteria included a) inability to provide consent, b) insufficient English proficiency, c) current primary diagnosis of eating disorder, psychosis, personality disorder or primary post-traumatic stress disorder, d) substance dependence for the past 3 months, e) pregnancy, f) history or current neurological disorder or prior brain injury, g) ECT or TMS in the last 6 months, h) contraindication to MRI.
Attrition
Four TRD participant datasets were excluded for excessive head motion during the scan .
Sex as a biological variable
not detected.
Subject Demographics
Age: All participants were aged between 18 and 65 years old.
Randomization
not detected.
Blinding
not detected.
Power Analysis
not detected.
Replication
not required.

Table 2: Key Resources Table

Your Sentences	REAGENT or RESOURCE	SOURCE	IDENTIFIER
Software and Algorithms			
2.3 Imaging data analyses Data processing and analyses were performed using Matlab R2018b (The Mathworks inc, Natick,	Matlab		Suggestion: MATLAB (RRID:SCR_001622)(link)
Massachusetts) , SPM12 (Wellcome Trust Centre for Neuroimaging , London , UK) and CONN functional connectivity toolbox v16b (http:www.nitrc.orgprojectsconn) .	functional connectivity toolbox		Suggestion: Functional Connectivity Toolbox (RRID:SCR_006394)(link)
2.4 Analyses of demographic and clinical factors Statistical analyses were performed using SPSS software version 21	SPSS		Suggestion: SPSS, RRID:SCR_002865(link)

Other Entities Detected

Your Sentences	Recognized Entity
Statistical Tests	
The correlation coefficients were then used in subsequent second-level statistical analysis , and compared between the TRD , TSD , and HC groups through ANOVA tests of variance (for three groups) .	ANOVA
All three groups were compared for age and gender (demographic variables), using a one-way ANOVA and chi square test, respectively.	chi square test
The TRD and TSD groups were compared for age of onset, age of first episode, depression severity (HAMD-17 score), functionality (SOFAS score), severity of worst depressive episode, number of previous depressive episodes, using student t-tests.	student t-tests
The groups were also compared for history of hospitalizations, suicidal attempts and suicidal ideation, using chi square tests of independence.	chi square tests
The effect of history of suicidal ideation, history of suicidal attempt, and ECT treatment in explaining the variance of the neural measures were also explored, using independent samples t-tests to compare differences in the FC measures between those with and without history of suicidal ideation, suicidal attempt and ECT treatment.	t-tests

SciScore is an automated tool that is designed to assist expert reviewers by finding and presenting formulaic information scattered throughout a paper in a standard, easy to digest format. ***SciScore is not a substitute for expert review.*** SciScore also checks for the presence and correctness of several unique identifiers, including RRIDs (research resource identifiers) in the manuscript, detects sentences that appear to be missing RRIDs, and can even suggest RRIDs under certain circumstances. **All RRID suggestions should be verified;** only the author can know whether the suggestions are correct.
