Document Identifier: **PMC8968536**

SciScore Report

Below you will find your SciScore report containing three tables. Your score is calculated based on adherence to scientific rigor criteria (Table 1) and identification of key biological resources (Table 2). Table 3 contains statistical tests and oligonucleotides but is not scored. If SciScore makes any mistakes, please contact us to help us learn and improve.

Table 1: Rigor Adherence Table

Ethics
not required.
Inclusion and Exclusion Criteria
Commentary papers, correspondence, editorials, letters, news items, perspectives, historical articles, practice guidelines, hospital data and laboratory surveillance will also be considered for inclusion in this scoping review.
Attrition
not required.
Sex as a biological variable
not required.
Subject Demographics
Age: not required.
Weight: not required.
Randomization
A piloting of title and abstract screening for 20 random articles identified by using the similar search will be done to understand the consensus level among all reviewers .
Blinding
not detected.
Power Analysis
not detected.
Replication
Number: Both titles and abstracts screening along with full-text screening will be done by four reviewers in pairs where each article will be screened at least twice and any discordance during each stage will be reassessed and ruled out by discussion .

Table 2: Key Resources Table

Your Sentences	REAGENT or RESOURCE	SOURCE	IDENTIFIER
Software and Algorithms			
Table 1 Key steps in the screening and evidence selection process Trial Initial search in PubMed and Google Scholar with the search terms Importing 20 references in Rayyan .	PubMed		Suggestion: PubMed (RRID:SCR_004846)(link)
ai for pilot title and abstract screening All reviewers screen the same articles with the Blinds on by using the inclusion criteria Consistency attained by 75 or more for approaching next stage Phase I(Searching and screening of electronic search results) Searching in the academic electronic databases: PubMed , EMBASE , Web of Science , PLOS , ScienceDirect , Scopus and Hinari Grey literature search in Google Scholar Deduplication title and abstract screening by four reviewers in pairs Resolving conflict of decision through discussion among the team Full-text screening of the selected literature Discussion for agreement on any discordant in full-text review Phase II(Searching and screening of hand search) Manual searching of the literature with potential from reference list of the included full-text literature Deduplication title and abstract screening , followed by full-text screening for eligibility by four reviewers in pairs Discussion for agreement on inclusion Data extraction A predefined data-charting tool was developed and piloted during the protocol development phase where two reviewers independently charted data from 10 literature which were identified during the preliminary search .	EMBASE		Suggestion: EMBASE (RRID:SCR_001650)(link)
	Google Scholar		Suggestion: Google Scholar (RRID:SCR_008878)(link)
To collect the data , Microsoft Excel will be used and each of the included evidence will be abstracted in a duplicate manner by two reviewers independently .	Microsoft Excel		Suggestion: Microsoft Excel, RRID:SCR_016137(link)

SciScore is an automated tool that is designed to assist expert reviewers by finding and presenting formulaic information scattered throughout a paper in a standard, easy to digest format. ***SciScore is not a substitute for expert review.*** SciScore also checks for the presence and correctness of several unique identifiers, including RRIDs (research resource identifiers) in the manuscript, detects sentences

that appear to be missing RRIDs, and can even suggest RRIDs under certain circumstances. **All RRID suggestions should be verified;** only the author can know whether the suggestions are correct.
